# Perceptron Learning Criterion

- 2-class classifier,  $i$ 'th training point  $\mathbf{x}^i$ :  $t_i = \pm 1$
- $y(\mathbf{x}^i) = h(\mathbf{w}^T \mathbf{x}^i) = h(a) = +1 (a \geq 0), = -1 (a < 0)$
- Declare Class  $\mathcal{C}_1 (t_i = +1)$  if  $\mathbf{w}^T \mathbf{x}^i \geq 0$
- Declare Class  $\mathcal{C}_2 (t_i = -1)$  if  $\mathbf{w}^T \mathbf{x}^i < 0$
- Combined: (SVM-like!) Correct, if  $t_i \mathbf{w}^T \mathbf{x}^i \geq 0$
- Perceptron penalty: 0 if correct, else sum
- Simple criterion:  $E(\mathbf{w}) \triangleq -\sum_{\forall i \in \mathcal{M}} t_i \mathbf{w}^T \mathbf{x}^i$
- no penalty for 'how much' misclassification
- Solved numerically, Cauchy's weight update rule

# Iterative Weight Update: Learning

[https://upload.wikimedia.org/wikipedia/commons/d/d3/Augustin-Louis\\_Cauchy\\_1901.jpg](https://upload.wikimedia.org/wikipedia/commons/d/d3/Augustin-Louis_Cauchy_1901.jpg)

- A.-L. Cauchy [1789-1857]
- **Cauchy's Rule**[1849]
- $\mathbf{w}^{(\tau+1)} = \mathbf{w}^{(\tau)} - \eta \nabla E(\mathbf{w})$
- dim cons?
- Step ' $\eta$ '?
- why '-'?[00:44]

- $s_l = \frac{E(w + \delta w) - E(w)}{(w + \delta w) - (w)} = \frac{E(w + \delta w) - E(w)}{\delta w}$
- $\lim_{\delta w \rightarrow 0} : \partial E / \partial w \implies \nabla E(\mathbf{w})$
- $\mathbf{w}: [w_j], \nabla E(\mathbf{w}) = [\partial E / \partial w_j]$
- '-' sign: go against the gradient!

- ' $\eta$ ': step size or learning rate, tuning (adaptive?)
- small  $\eta$ : small steps, longer attain local min
- large  $\eta$ : large steps, may miss local min

# Multi-Layer Perceptron

- h'layer activ'n fn:  $z_j$ :  $h(a_j^{(1)})$ : sigmoid/tanh
- o'layer activ'n fn:  $y_k$ :  $\sigma(a_k^{(2)})$ : prob specs
- Regression: Identity  
 $y_k = a_k^{(2)}$
- Classification: sigmoid/softmax;  
sigmoid: 2-class  
softmax: multi-class
- softmax =  $\exp / \sum \exp$
- Sgn: harsh  $\tanh(\cdot)$ ;  
0/1 step: harsh  $\sigma(\cdot)$

# Activation Fns: Logistic Sigmoid

- $\sigma(a) \triangleq \frac{1}{1+e^{-a}}$  softer unit step; differentiable
- $a \rightarrow -\infty, \sigma(a) \rightarrow 0$ ;  $a \rightarrow +\infty, \sigma(a) \rightarrow 1$ ;  
 $a = 0, \sigma(a) = 0.5$
- (-) Computation with exponentials is difficult!

- $\tanh(a) \triangleq \frac{e^{+a} - e^{-a}}{e^{+a} + e^{-a}}$  soft signum; differentiable
- $a \rightarrow -\infty, \sigma(a) \rightarrow -1; a \rightarrow +\infty, \sigma(a) \rightarrow +1;$   
 $a = 0, \sigma(a) = 0$
- (-) computation with exponentials is difficult!
- (-) grad  $\rightarrow 0$  as curve saturates! vanishing grad

[Home Page](#)[Title Page](#)[Contents](#)[◀](#) [▶](#)[◀](#) [▶](#)[Page 13 of 30](#)[Go Back](#)[Full Screen](#)[Close](#)[Quit](#)

# Activation Fns: tanh: Development

- $2\sigma(a) - 1$ : stretch to  $[0, 2]$ , then shift down by 1
- $\frac{2}{1+e^{-a}} - 1 = \frac{2-1-e^{-a}}{1+e^{-a}} = \frac{(1-e^{-a})e^{+a/2}}{(1+e^{-a})e^{+a/2}} = \frac{e^{+a/2}-e^{-a/2}}{e^{+a/2}+e^{-a/2}} = \tanh\left(\frac{a}{2}\right)$

[Home Page](#)[Title Page](#)[Contents](#)[◀](#) [▶](#)[◀](#) [▶](#)[Page 14 of 30](#)[Go Back](#)[Full Screen](#)[Close](#)[Quit](#)

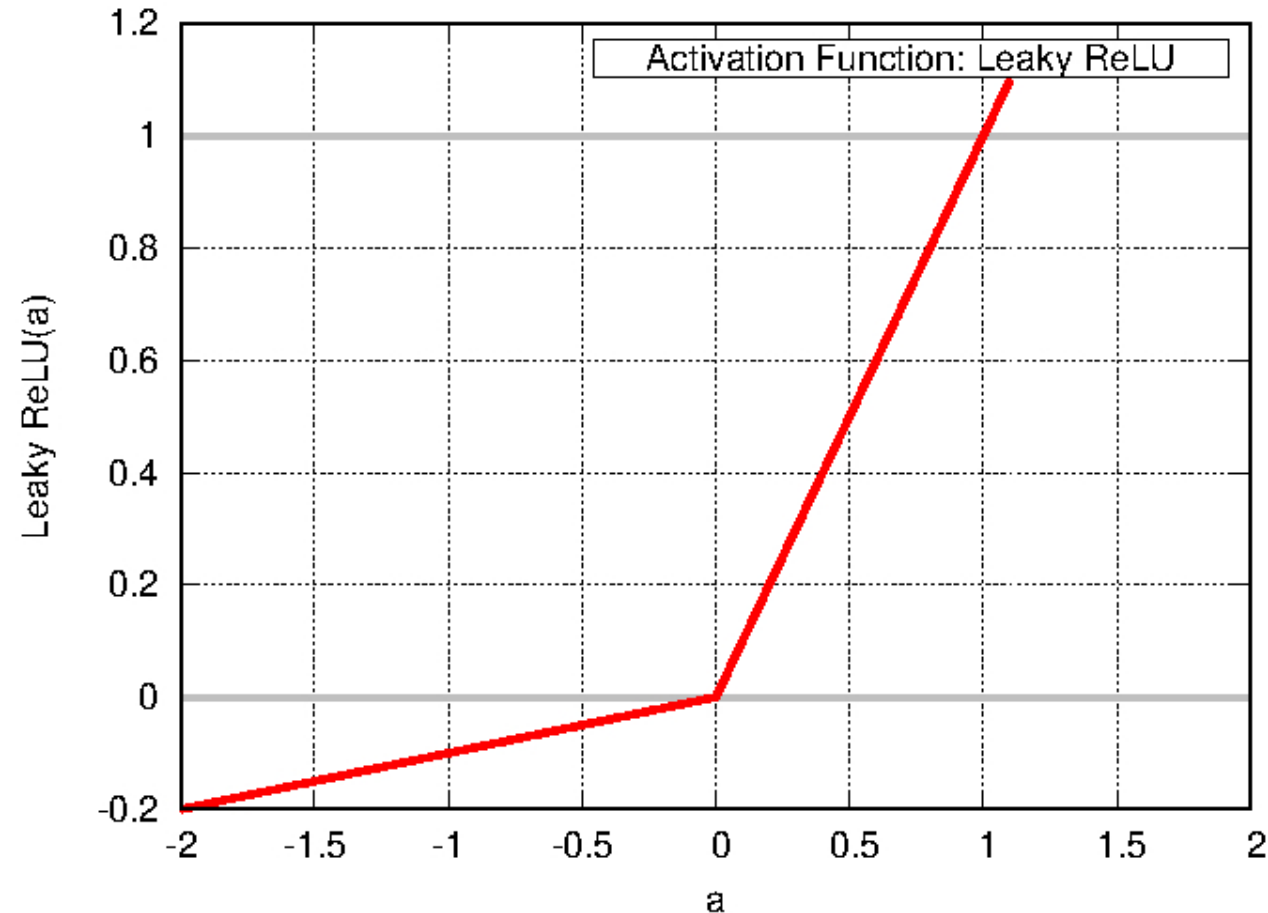

# Activation Fns: ReLU

- $ReLU(a) \triangleq a, a \geq 0; 0, \text{otherwise}$  Easy to compute
- (+) no vanishing gradient as no saturation!
- (-) negative inputs, no gradient

[Home Page](#)[Title Page](#)[Contents](#)[◀ ▶](#)[◀ ▶](#)[Page 15 of 30](#)[Go Back](#)[Full Screen](#)[Close](#)[Quit](#)

# Activation Fns: Leaky ReLU

- $LeakyRelU(a, \alpha) \triangleq \max(\alpha a, a), \alpha \in (0, 1)$
- $a \geq 0: \max(\alpha a, a) = a \ (\alpha \in (0, 1))$
- $a < 0: \alpha a$ : fraction of more neg:  $\alpha a > a$ , slope  $< 1$
- (-) Not diff at  $a = 0$ : handled algorithmically

# Activation Fns: eLU
